

RAG Testing Knowledge Base

This document is created for testing a Personal Knowledge Base Assistant. The assistant should answer questions only from information contained in this document.

1. Project Information

The project is called Atlas Knowledge Hub. It was started in 2024 to organize internal documents and make information easier to search. The project uses a retrieval-augmented generation (RAG) architecture.

2. Team Information

The Atlas Knowledge Hub team has 12 members. The project lead is Neha Sharma. The engineering team primarily uses Python. The documentation team maintains the knowledge base and reviews documents every Friday.

3. Technical Details

The application uses ChromaDB as its vector database. Sentence Transformers are used to generate text embeddings. The embedding model used for this testing document is all-MiniLM-L6-v2. Groq is used to generate the final answer from retrieved context.

4. RAG Process

When a user asks a question, the system converts the question into an embedding and searches the vector database for relevant text chunks. The retrieved chunks are provided to the language model as context. The language model should use only that context when producing the answer.

5. Important Facts for Testing

Fact	Value
Project name	Atlas Knowledge Hub
Project start year	2024
Team size	12 members
Project lead	Neha Sharma
Programming language	Python
Vector database	ChromaDB
Embedding model	all-MiniLM-L6-v2

6. Grounding Rule

If a question cannot be answered using the information in this document, the assistant should clearly state that the information is not available in the uploaded notes rather than guessing or using outside knowledge.
